

# Plymouth Oil Service Inc. introduces.....

## *A new line of plumbing products and services!*

Plymouth Oil Service Inc now has the capability to eliminate old or corroded copper water lines in your home. Now offering Viega Products, known as a global leader in plumbing and heating technology; we can install modern plastic piping called PEX pipe.

Why copper is out and plastic is in? It's simple....

- Copper corrodes over time causing leaks, especially with well-water
- Copper is vulnerable to cracking in cold winter months
- Old copper soldering may contain lead and other harmful contaminants
- The price of copper is expensive

PEX piping (cross-linked polyethylene) is smoother and flexible so it doesn't corrode or scale. It will not become damaged by hard water. It can withstand a wide range of temperatures from below 32 degrees to 200 degrees Fahrenheit. PEX is also burst-resistant because of its ability to expand and contract. These pipes are created in greater lengths than traditional copper pipes therefore needing fewer fittings; which means faster installations and less opportunity for leaks!

Call and ask about the switch to PEX piping today!
